OVERVIEW

With the evolving strategies for locoregional management of early-stage breast cancer, the decisions to de-escalate surgery and when to omit axillary lymph node dissection (ALND) and/or sentinel lymph node biopsy (SLNB) and to select the appropriate radiation therapy (RT) dosing should always involve shared decision-making between the patient and clinician, considering the specific tumor biology, other clinical features, and the potential impact on adjuvant systemic therapy decisions. Using a case-based approach can be beneficial to understand the de-escalation approaches in surgery and radiation treatment.

TARGET AUDIENCE

This program is designed to meet the educational needs of physicians/oncologists, nurse practitioners, nurses, physician associates, pharmacists, and other health care professionals who manage patients with cancer.

FEATURED SPEAKERS FROM
NCCN MEMBER INSTITUTION

***UCLA Jonsson Comprehensive
Cancer Center***

Aditya Bardia
MD, MPH

Susie McCloskey
MD, MSHS

Mediget Teshome
MD, MPH

LEARNING OBJECTIVES

- Review new and emerging data in the locoregional management of invasive non-metastatic breast cancer and integrate key findings into clinical practice.
- Recognize key factors that influence selection of systemic neoadjuvant/adjuvant therapy for patients with non-metastatic breast cancer.
- Describe how interdisciplinary collaboration among surgeons, radiation oncologists, medical oncologists, and shared-decision with the patient is essential for individualized treatment to optimize outcomes and minimize morbidity.
