# Early-stage Classical Hodgkin Lymphoma (CHL): Can We Eliminate Radiation Therapy for Most Patients?

Ranjana H. Advani, MD
*Stanford Cancer Institute*

National Comprehensive Cancer Network®

**NCCN.org** – For Clinicians | **NCCN.org/patients** – For Patients

# Learning Objectives

- Describe the challenges associated with the management of early stage CHL and the need to develop individualized treatment options
- Review the evidence from recent clinical trials evaluating the use of chemotherapy alone for early stage CHL
- To understand the evolving criteria used in interpretation of PET scans (Deauville Criteria)
- To understand the potential use and limitations of PET scans in guiding treatment decisions in early stage CHL

# Stage I-II Classical Hodgkin Lymphoma (CHL)
# Evolution of "The Gold Standards"

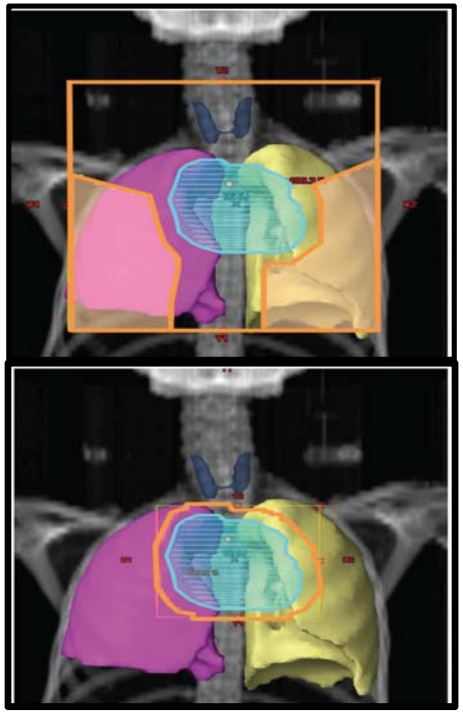
- Late 1960's-1970's: Extensive Radiation Therapy (RT)
- Late 1970's-1990's: Aggressive combined modality therapy (CMT) with extended field RT
- Mid 1990's: Reduced intensity CMT with involved field RT
- Current CMT: Further reduction in chemotherapy with involved nodal/involved site RT
- Current focus: PET-adapted strategies to assess if RT can be eliminated

## Evolution of Radiation Therapy

- Involved Field Radiation Therapy (IFRT)
  - Treats entire lymphoid regions defined by arbitrary anatomic landmarks
- Involved Site Radiation Therapy (ISRT)
  - Targets only the specific volume initially involved with minimal margins
- Involved Nodal Radiation Therapy (INRT)
  - Special case of ISRT where pre-chemo PET-CT in treatment position required
  - More accurate volume definition of treatment field

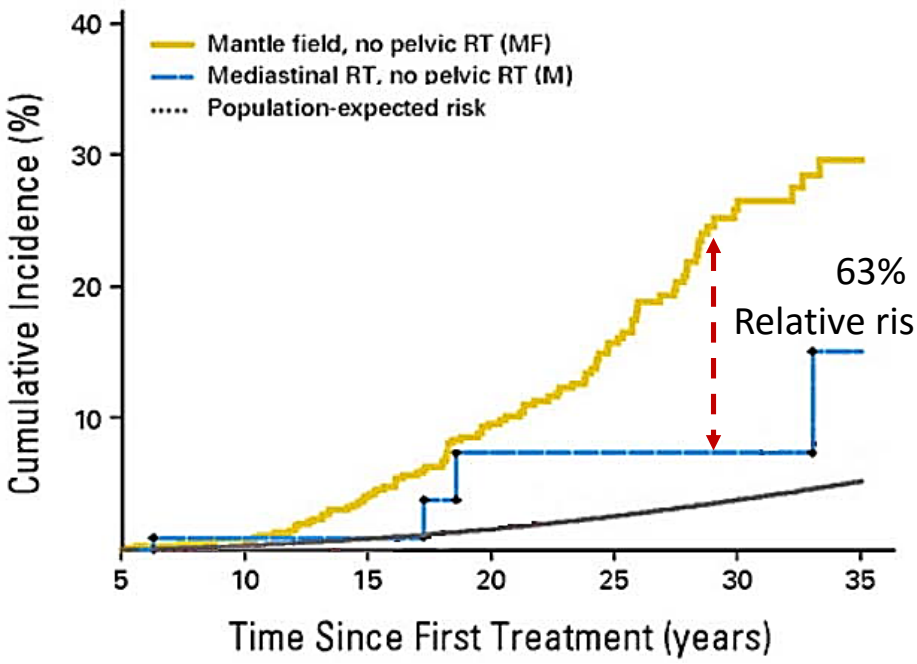
# Evolution of RT: IFRT vs INRT

Maraldo MV, et al. *Int J Radiat Oncol Biol Phys*. 2013;85(4):1057-1065.



Campbell BA, et al. *Ann Oncol*. 2012;23(5):1259-1266.

# Implications for Transition to IFRT
# Clinical Evidence of Reduction in Breast Cancer Risk



63% reduction in
Relative risk of breast cancer

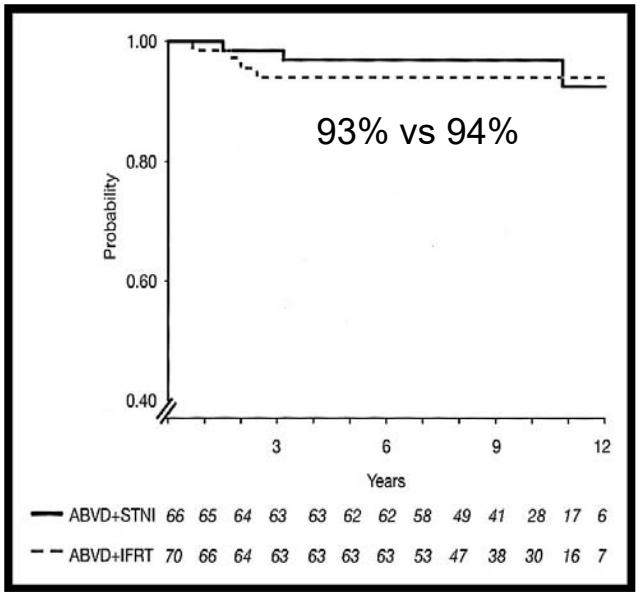
De Bruin M L et al. *J Clin Oncol.* 2009;27(26): 4239-4226.

# Stage I-II CHL

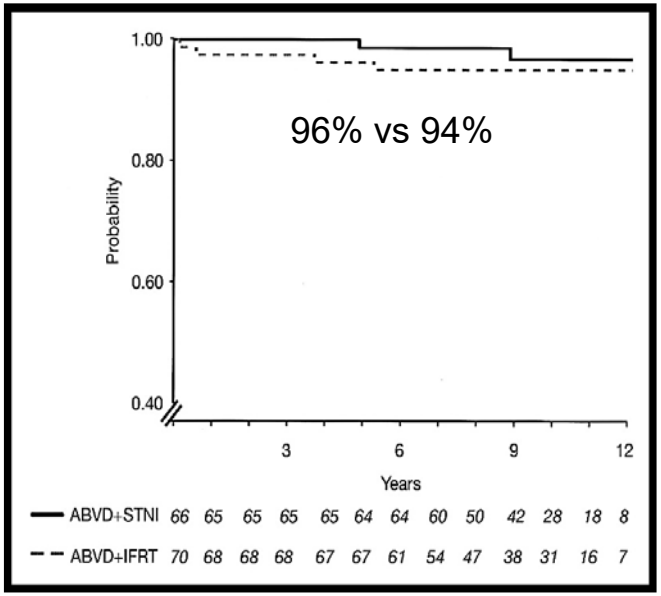
## ABVD X 4 + IFRT: Established Standard of Care

### Long-Term Results (12 years)

Freedom From Progression (FFP)



Overall Survival (OS)



Bonadonna G, et al. *J Clin Oncol.* 2004;22(14):2835-2841.

# Stage I-II CHL: Key Issues

- Definition of “favorable” vs “unfavorable” early stage disease
- Can risk-adapted strategies be employed to omit radiation therapy?
- Considerations for the treatment of patients with bulky mediastinal disease
- Future considerations
  - Incorporation of novel agents
  - Identification of biological subsets to guide therapy

# Stage I-II CHL: Key Issues

- Definition of “favorable” vs “unfavorable” early stage disease

# Risk Factors in Early Stage CHL

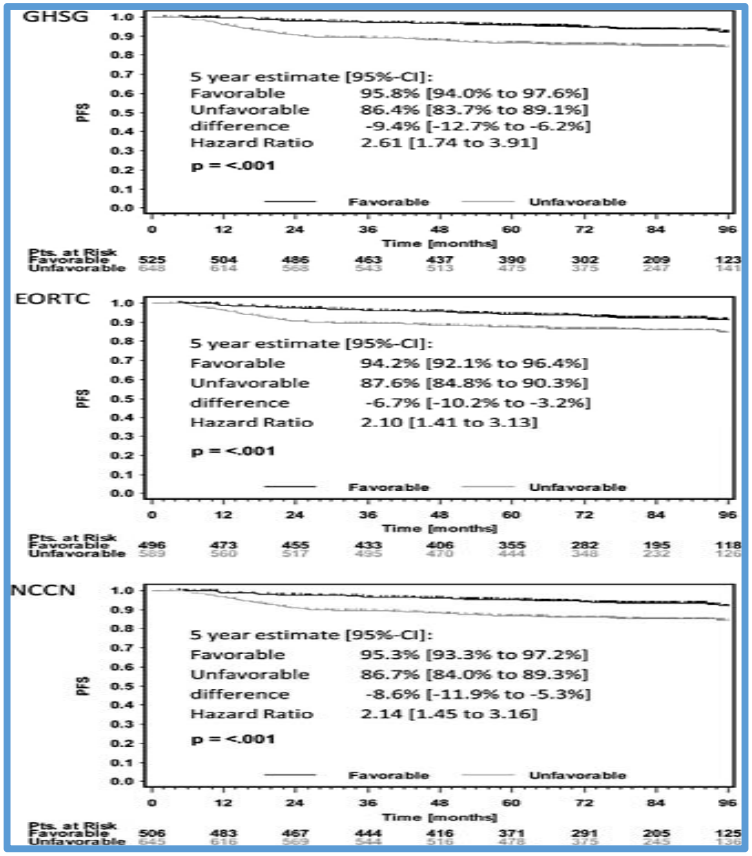
## Risk Factors: Variably defined

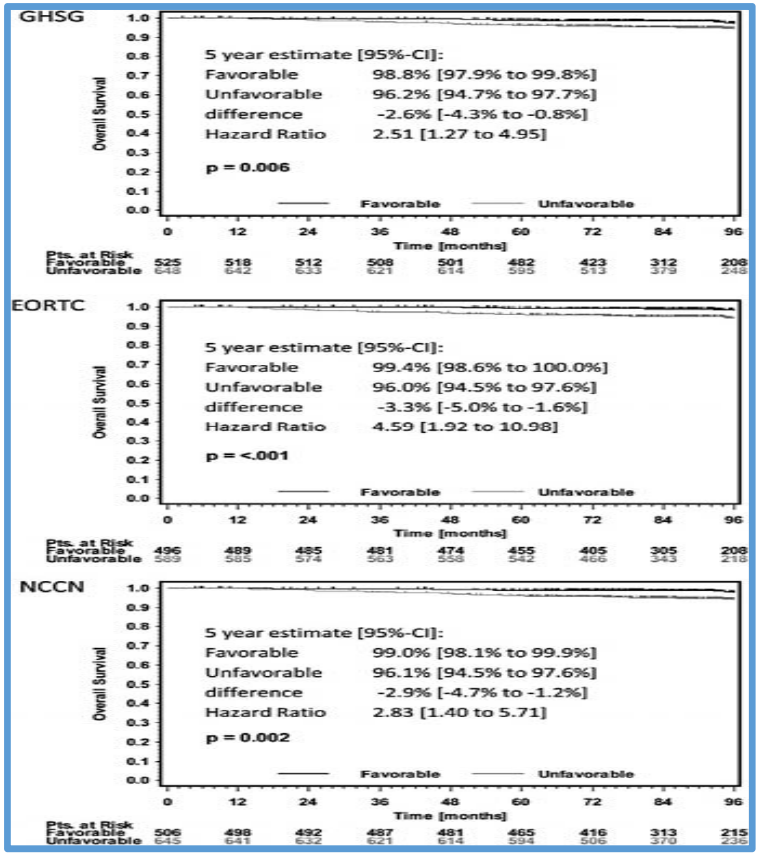
| GHSG | EORTC | NCCN |
|---|---|---|
| Large mediastinal mass (ratio ≥ 1/3)* | Large mediastinal mass (ratio ≥ 0.35) | Large mediastinal mass (ratio > 1/3) |
| | | Bulk > 10 cm |
| | Age ≥ 50 years | |
| ≥1 extranodal lesion* | | |
| ESR ≥ 50 (A) or ≥ 30 (B) | ESR ≥ 50 (A) or ≥ 30 (B) | ESR ≥ 50 (A) |
| | | B-symptoms |
| ≥3 nodal areas (out of 11 GHSG areas) | ≥4 nodal areas (out of 5 supra-diaphragmatic. EORTC areas) | ≥4 nodal regions (out of 17 Ann Arbor regions) |

Klimm B, et al. *Ann Oncol.* 2013;24(12):3070-3076.

# Outcomes in Early stage CHL Using Risk Definitions: GHSG, EORTC, or NCCN

## All definitions work largely because of significant overlap in risk factors

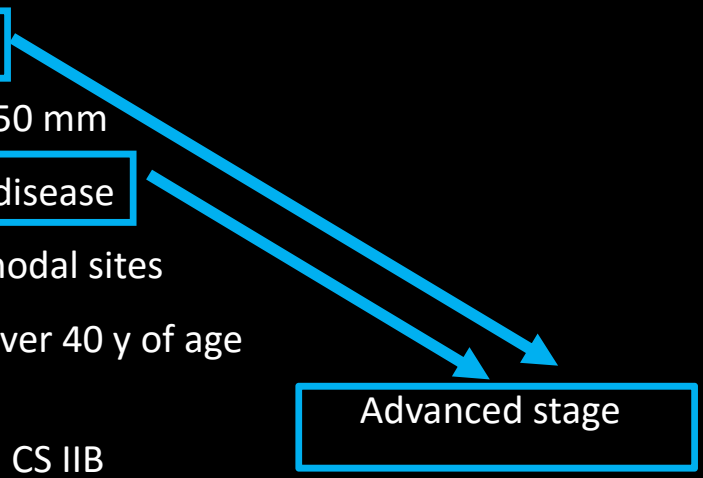




Klimm B, et al. *Ann Oncol*. 2013;24(12):3070-3076.

# HL Clinical Trial Treatment Groups
# Europe vs North America

| Europe (GSHG, GELA, EORTC) | | USA/Canada |
|---|---|---|
| | Stage | |
| Early favorable | CS I, IIA, B<br>No risk factors | Limited stage |
| Early unfavorable | CS I, IIA, B | |
| (Intermediate) | B Sx<br>ESR > 50 mm<br>Bulky disease<br>> 2-3 nodal sites<br>Men over 40 y of age | |
| Advanced stage | CS III-IV,<br>Selected CS IIB | Advanced stage |



Courtesy Connors JM, et al. *53rd ASH Annual Meeting*. 2010 education session.

# Early Stage Classical Hodgkin Lymphoma (CHL)

## Expected outcomes and goals of therapy in 2016

| | % Cure Rate | Therapeutic Priority |
|---|---|---|
| **Early Favorable (Stage I-II)** | **90** | **Reduce Toxicity** |
| **Early Unfavorable (stage I, II with risk factors)** | **80-85** | **Increase Efficacy *without* any increase in toxicity** |

Risk Factors: Variably defined

- Large mediastinal mass
- Extranodal lesions
- ≥ 3 nodal sites
- ↑ ESR
- age > 40
- MC histology

# Case 1: Early Stage CHL

- 36-year-old woman presents with a 2-month h/o pruritus. She denies fevers, night sweats, or weight loss
- Exam: well appearing and has a 2 cm L neck mass
- PET/CT scan: bilateral supraclavicular nodes measuring ~ 2 cm (SUV 6-8) and an upper mediastinal node measuring 5 x 2 cm (SUV 11.1)
- Excisional biopsy: classical HL, nodular sclerosing type
- Labs: WBC 5.6 K/µL with a normal differential, Hgb 12.7 g/dL, plt 154 K/µL, ESR 45, normal renal and hepatic function
- Final Diagnosis: Stage II A CHL

# Case 1: Therapy Choices for Stage IIA disease

1: ABVD x 2 + 20 Gy ISRT

2: ABVD x 4 + 30 Gy ISRT

3: Stanford V 8 weeks + 30 Gy ISRT

4: ABVD x 2 + Esc BEACOPP x 2 + ISRT

5: ABVD x 3-4

6: ABVD x 6

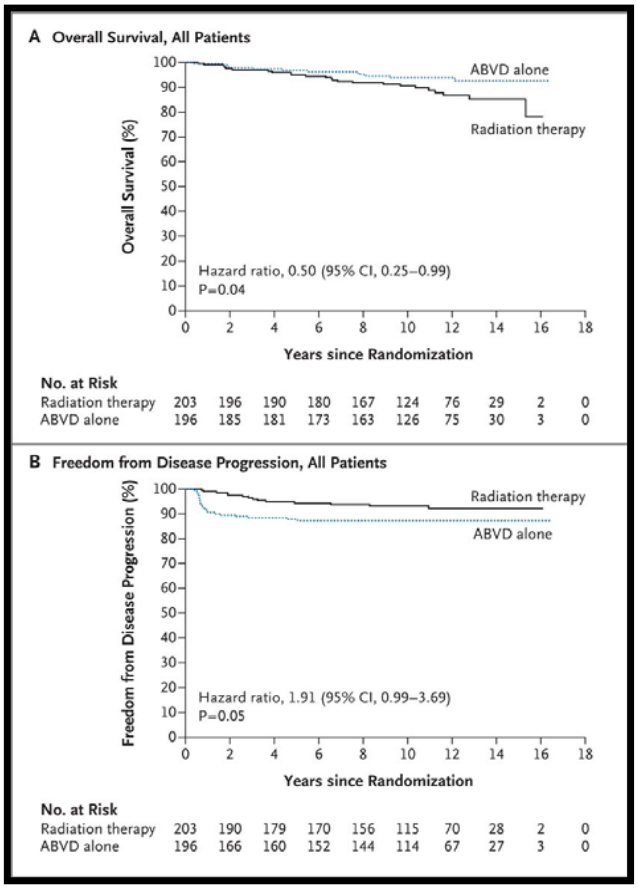
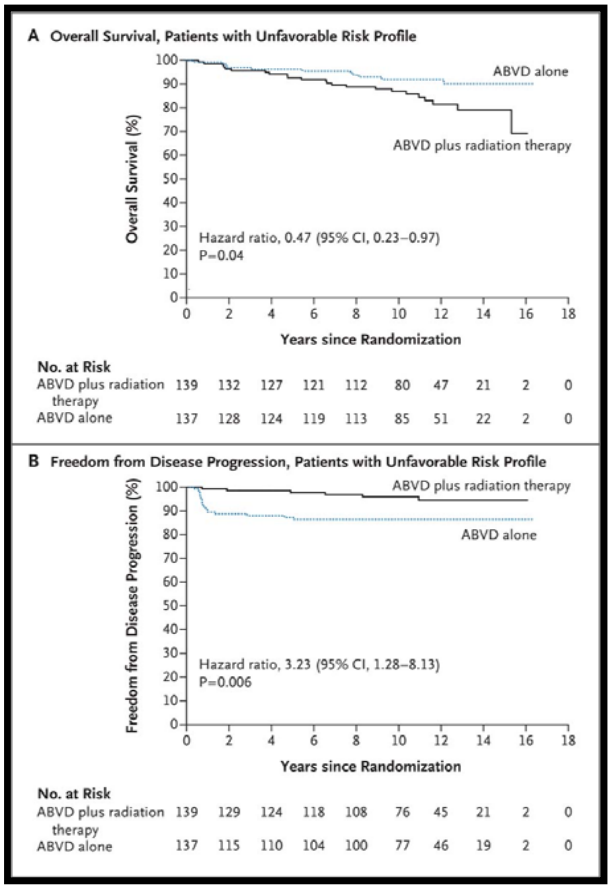
# Questions

- Can favorable patients receive less treatment?
- Should early stage unfavorable patients receive more treatment?
- Can we better select patients for chemotherapy alone?

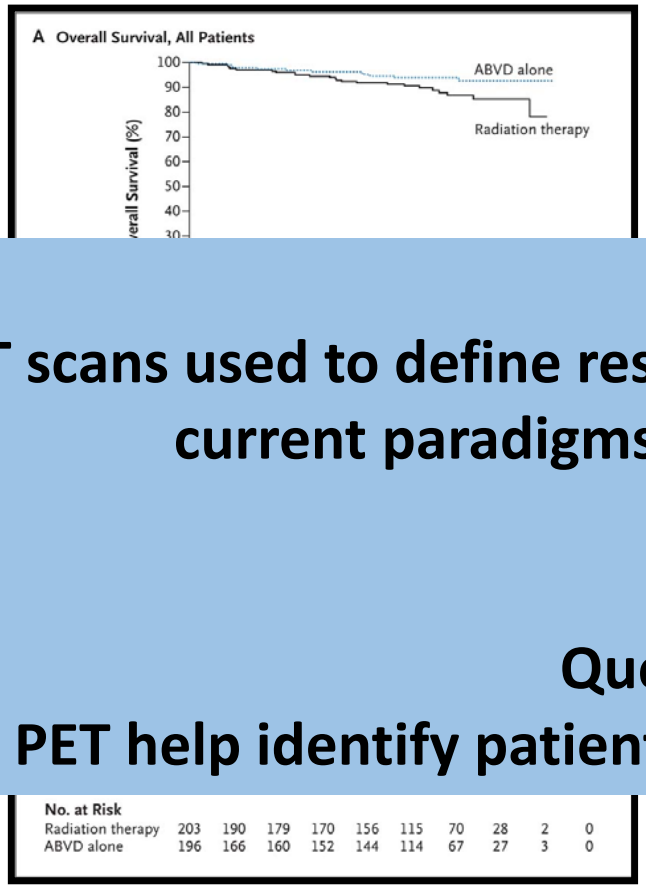
# NCIC H6 Trial: CT Adapted Therapy
# Overall Survival and Freedom From Disease Progression

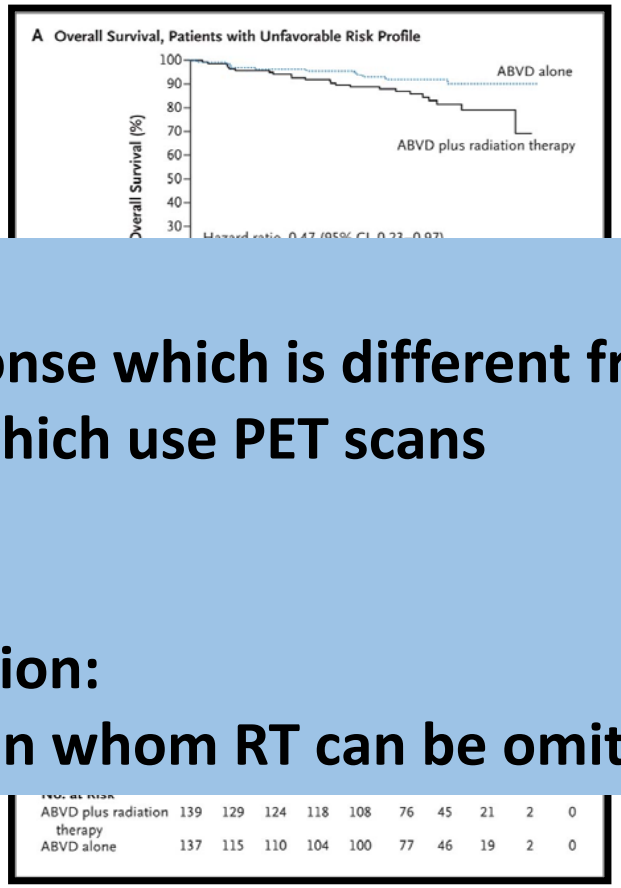




Meyer RM, et al. *N Engl J Med.* 2012;366(5):399-408.

# NCIC H6 Trial: CT Adapted Therapy
# Overall Survival and Freedom From Disease Progression





**CT scans used to define response which is different from current paradigms which use PET scans**

**Question:**
**Can PET help identify patients in whom RT can be omitted?**

Meyer RM, et al. *N Engl J Med.* 2012;366(5):399-408.

# PET/CT Imaging
# Potential Uses In CHL

- Staging: YES
- Response assessment: YES
  - End of therapy (EOT)

- ***Treatment modification based on PET/CT***
  - ***EOT***
  - ***Interim***

- Can modification of Rx based on EOT or interim PET/CT have the potential to select patients for treatment escalation or de-escalation?

- Do these modifications have the potential to improve outcomes?

# Report 'Wording' Nightmares for Clinicians

Common report

- Excellent response, there is minimal residual uptake in a para aortic node which could represent treated disease. Residual lymphoma cannot be excluded.

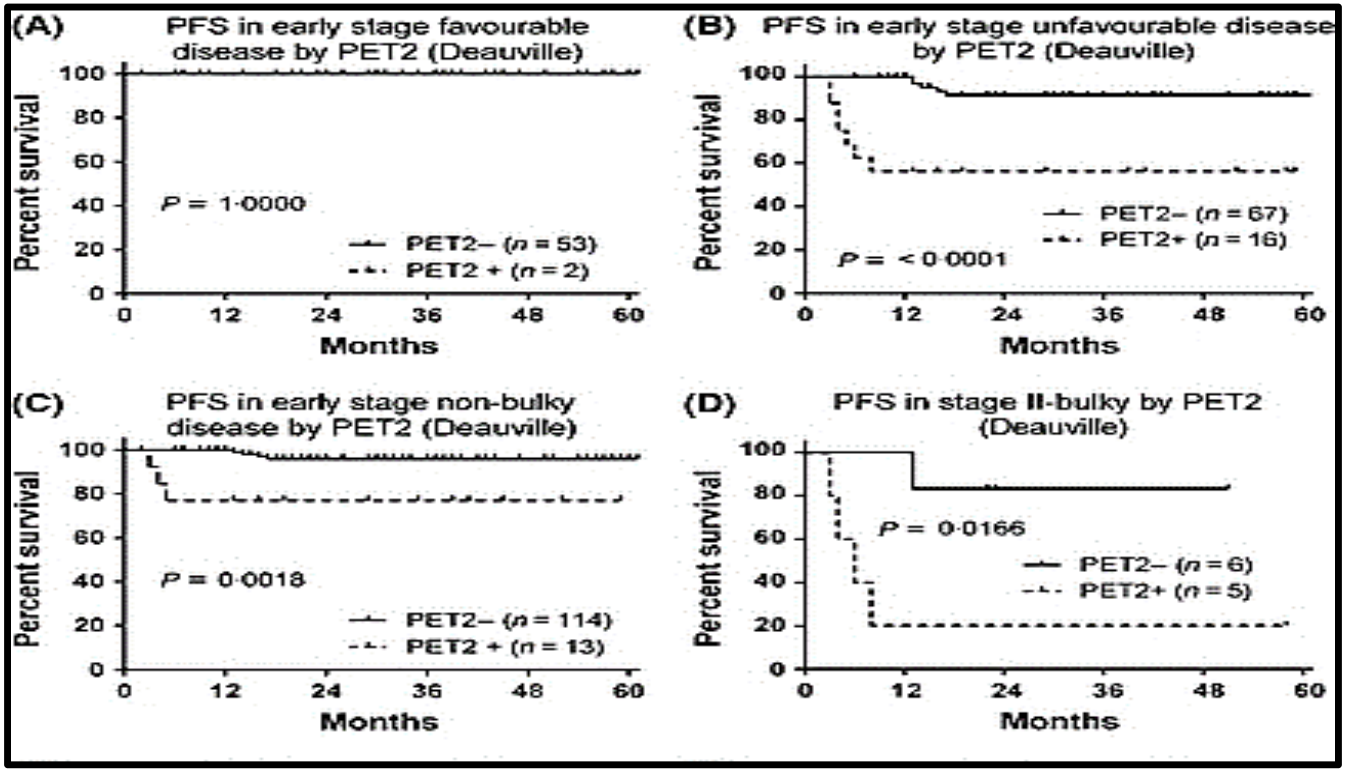
# Deauville 5-Point Scoring System

Score
1 No uptake
2 Uptake ≤ mediastinum
3 Uptake > mediastinum but ≤ liver
4 Uptake moderately higher than liver
5 Uptake markedly higher than liver and/or new lesions
X New areas of uptake unlikely to be related to lymphoma

Barrington SF, et al. *J Clin Oncol.* 2014;32(27):3048-3058.

# The Prognostic Value of Interim PET Scan in Patients With Early Stage CHL

## MD Anderson retrospective study using Deauville Criteria



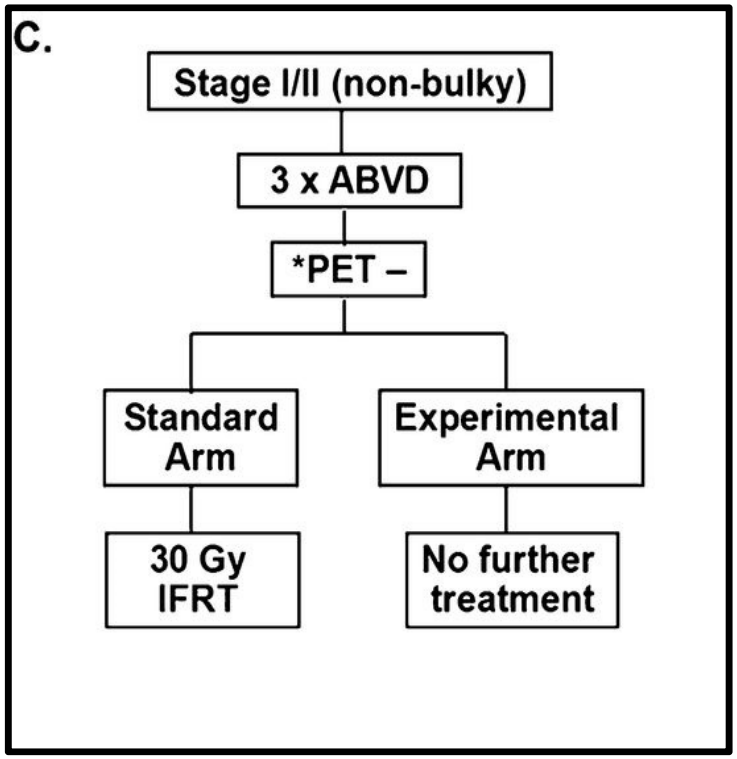
Oki Y, et al. *Br J Haematol.* 2014;165(1):112-116.

## Early Stage CHL

# Does a reduction in therapy based upon a negative interim PET impact PFS?

## Prospective Studies

# UK NCRI RAPID Trial: Stage I-IIA Non-Bulky



## PET scores after 3 cycles ABVD and treatment allocation

- Following 3 cycles ABVD 571 pts had a PET scan:
  - Score 1, 301 (52.7%)
  - Score 2, 125 (22.0%) –
  - Score 3, 90 (15.7%) –
  - Score 4, 32 (5.6%)
  - Score 5, 23 (4.0%) +
- 420 of 426 PET –ve pts randomised to IFRT (209) or NFT (211)
  - 6 not randomised; pt choice 3, clinician choice 2, error 1
- 25 of 209 pts randomised to IFRT did not receive this treatment:
  - patients declined 19
  - died 5
  - pneumonia 1

≥7% difference in PFS

~ 36% would have been considered unfavorable by GHSG or EORTC criteria

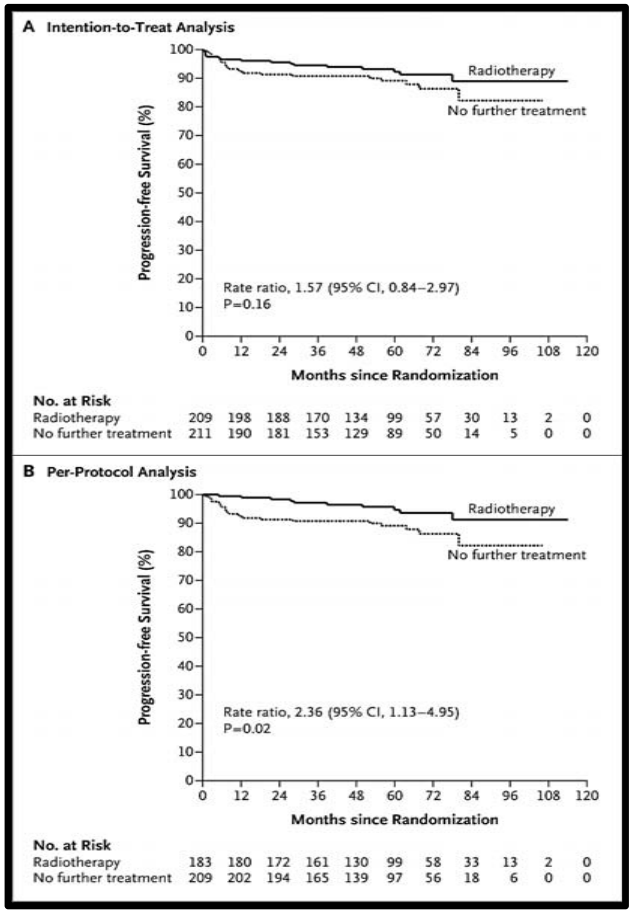
Radford J, et al. *N Engl J Med.* 2015;372(17):1598-1607.

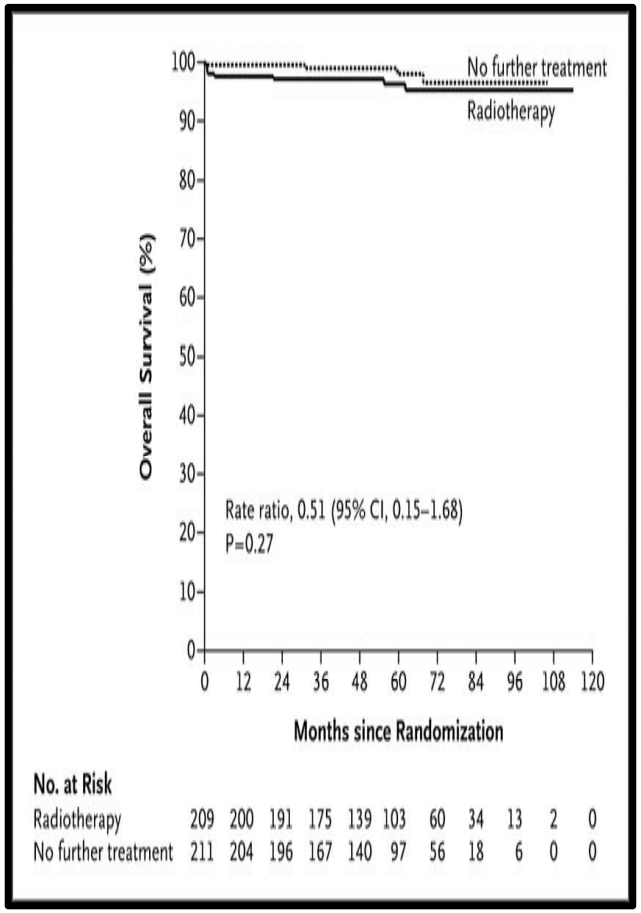
# UK NCRI RAPID Trial: Patient Characteristics

| Characteristic | Negative PET Findings | | Positive PET Findings (N=145) |
|---|---|---|---|
| | Radiotherapy (N=209) | No Further Treatment (N=211) | |
| Age — yr | | | |
| Median | 34 | 34 | 36 |
| Range | 16–74 | 16–75 | 18–75 |
| Sex — no. (%) | | | |
| Male | 103 (49.3) | 107 (50.7) | 96 (66.2) |
| Female | 106 (50.7) | 104 (49.3) | 49 (33.8) |
| Ann Arbor stage — no. (%)* | | | |
| IA | 69 (33.0) | 70 (33.2) | 48 (33.1) |
| IIA | 140 (67.0) | 141 (66.8) | 97 (66.9) |
| Favorable pretreatment features — no./total no. (%)† | | | |
| EORTC criteria[14] | 118/184 (64.1) | 122/185 (65.9) | 85/158 (53.8) |
| GHSG criteria[15,24] | 114/175 (65.1) | 136/184 (73.9) | 97/153 (63.4) |

Radford J, et al. *N Engl J Med.* 2015;372(17):1598-1607.

# UK NCRI RAPID Trial: Stage I-IIA Non-Bulky



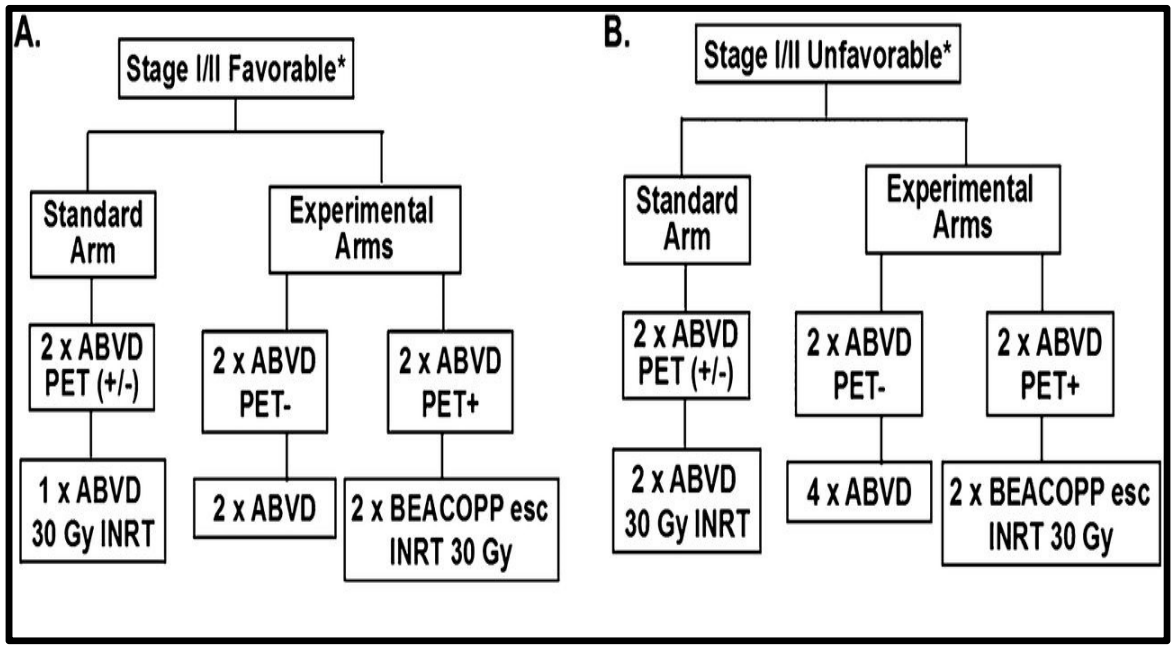


Radford J, et al. *N Engl J Med*. 2015;372(17):1598-1607.

# UK NCRI RAPID Trial: Conclusions

- Overall excellent outcomes
- PET score after 3 cycles ABVD had prognostic value in terms of EFS but EORTC/GHSG pre-treatment stratification did not
- PET score 5 is a particularly adverse feature
  - 5 episodes of progression and 3 HL deaths in 23 patients
- Findings need to be validated in other series of patients with early stage CHL
- If confirmed the role of PET in individualized treatment planning is strengthened

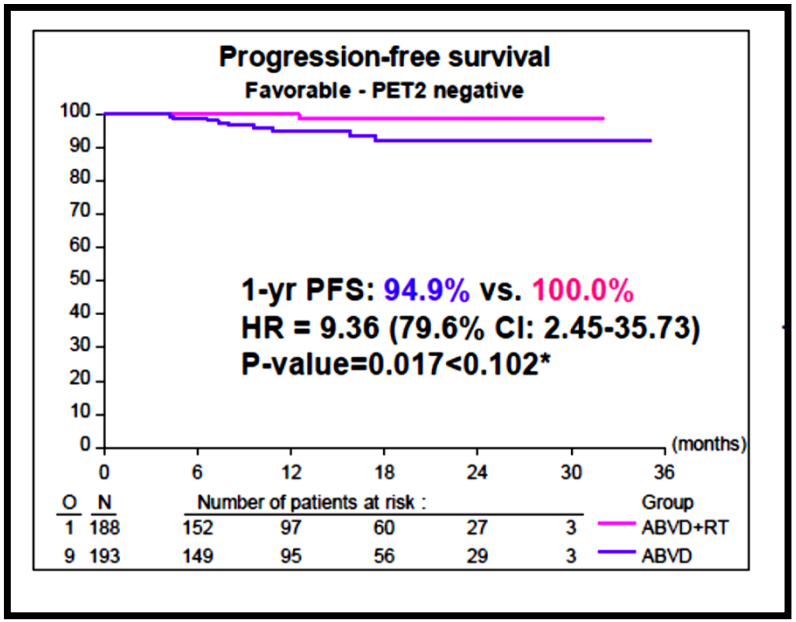
# EORTC H10 Trial: Randomized Trial
# Early FDG-PET Scan Guided Treatment Adaptation



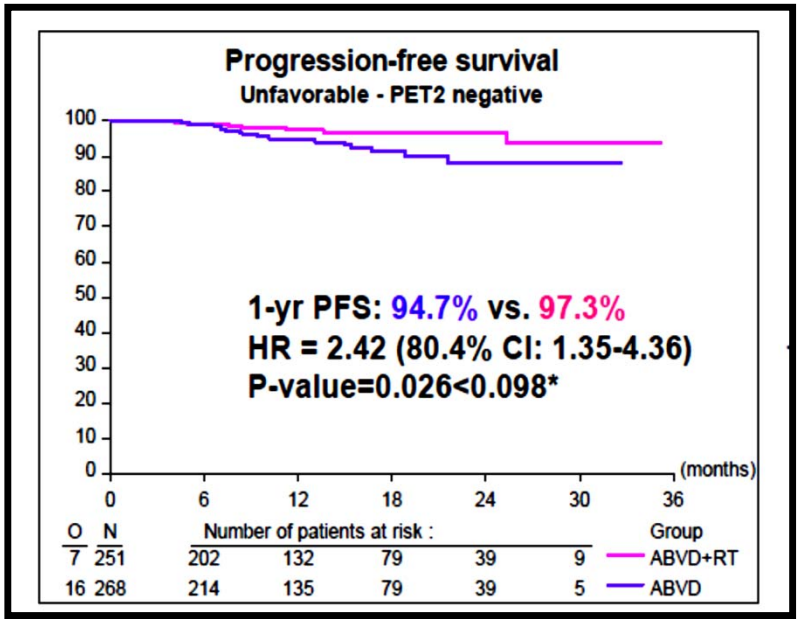
- PET scans scored according to the International Harmonization Project criteria
  - PET negative: Deauville score 1 or 2

Raemaekers JM, et al. *J Clin Oncol.* 2014;32(12):1188-1194.

# EORTC H10 Trial: PET– Group
## Futility Confirmed in Both Arms



| Events | 1 | 9 |
|---|---|---|
| Relapse | 1 | 9 |
| Death w/o relapse | 0 | 0 |



| Events | 7 | 16 |
|---|---|---|
| Relapse | 7 | 15 |
| Death w/o relapse | 0 | 1 |

Raemaekers JM, et al. *J Clin Oncol.* 2014;32(12):1188-1194.

# 5-Point Scale (Deauville Criteria) for Interpretation of Interim-PET scans

1. No uptake
2. Uptake ≤ mediastinum
3. Uptake > mediastinum but ≤ liver

Negative scan

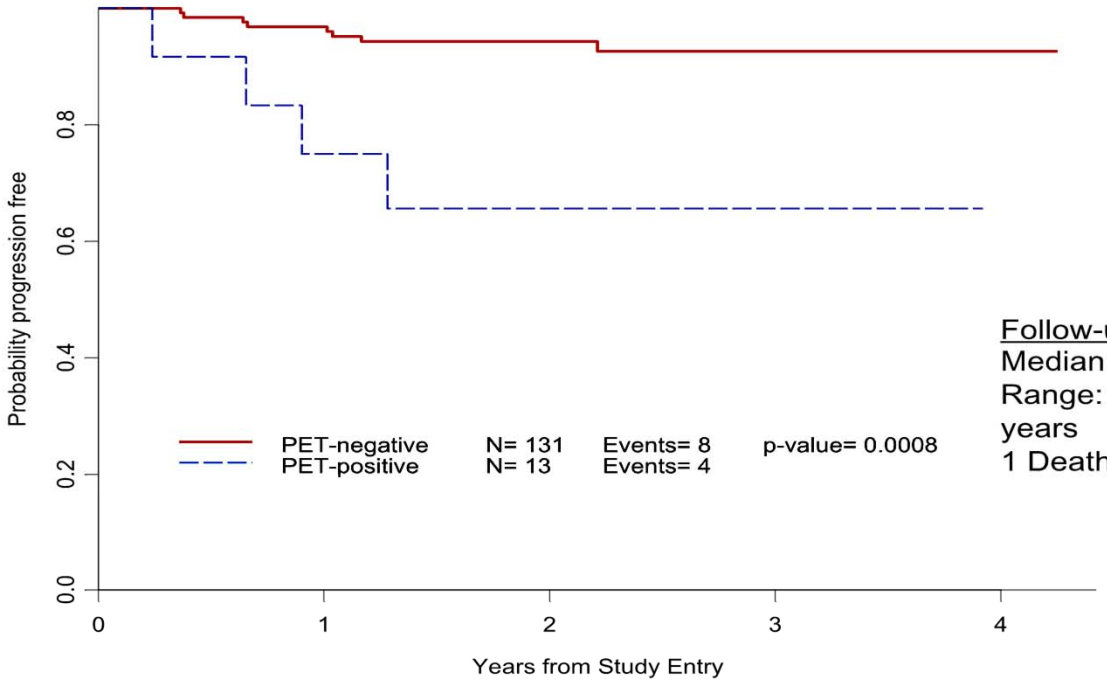
4. Moderately increased uptake compared to liver
5. Markedly increased uptake compared to liver or new areas of FDG uptake

Positive scan

Barrington SF et al. *J Clin Oncol* 2014;32(27):3048-3058.

# CALGB 50604 Progression Free Survival

## Post cycle 2 ABVD PET- and PET+ Patients



Follow-up time
Median: 2.1 years
Range: < 1month – 4.3 years
1 Death (Suicide – PET +)

| | Est. 3-yr PFS | Hazard Ratio |
|---|---|---|
| PET - | 92% (84%-96%) | 6.04 (1.82-20.08) |
| PET + | 66% (32%-86%) | |

# Stage I-II CHL: Key Issues

## Considerations in patients with bulky mediastinal disease

- Responses not reported separately for bulk vs other factors in most studies
- Therapy varies across different study groups
  - GHSG: bulk alone: treated on early stage unfavorable studies
    - ie, HD11 and HD14
  - GHSG: bulk + EN/B symptoms: treated on advanced stage studies
    - HD15 (esc BEACOPP x 6)
  - North America: By and large treated as advanced disease

# Randomized Phase III Studies Which Included Stage I-II X CHL

**Table** Results of Randomized Phase III Trials That Include Patients With Stage I–IIX Hodgkin Lymphoma

| Study (% bulky mediastinal mass) | Treatment Arm | N | Median Follow-up (yrs) | Overall Response Rate (%) | Outcome (% of pts) | Overall Survival (%) |
|---|---|---|---|---|---|---|
| **North American Trials** | | | | | | |

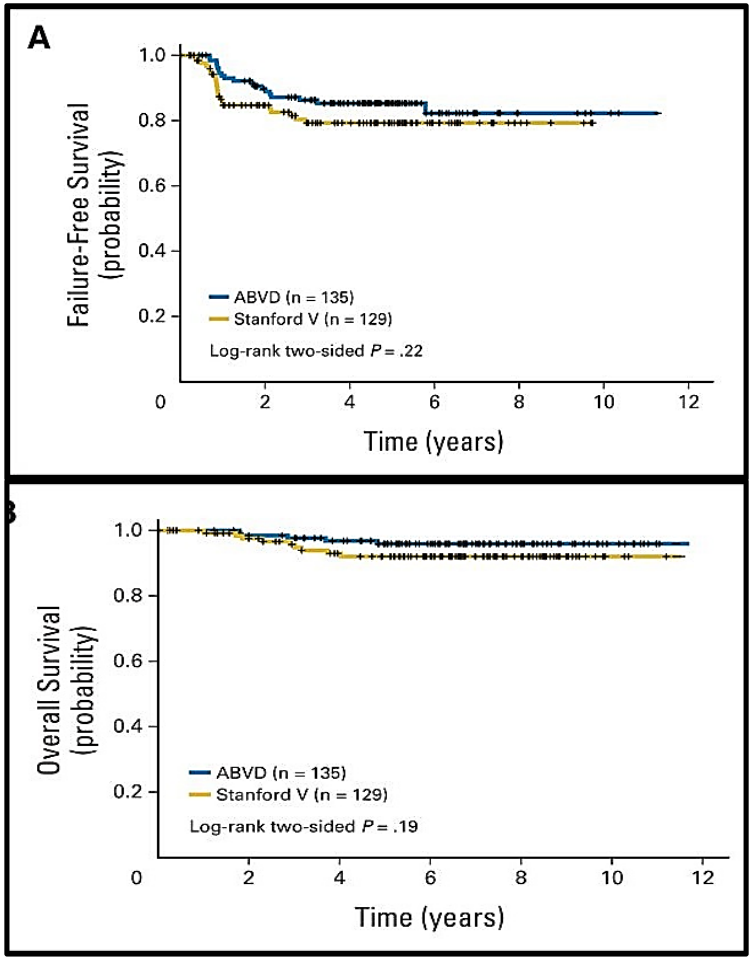
E2496: reported outcomes specifically in patients with bulky disease

Other studies have included 9-25% of patients with bulky disease

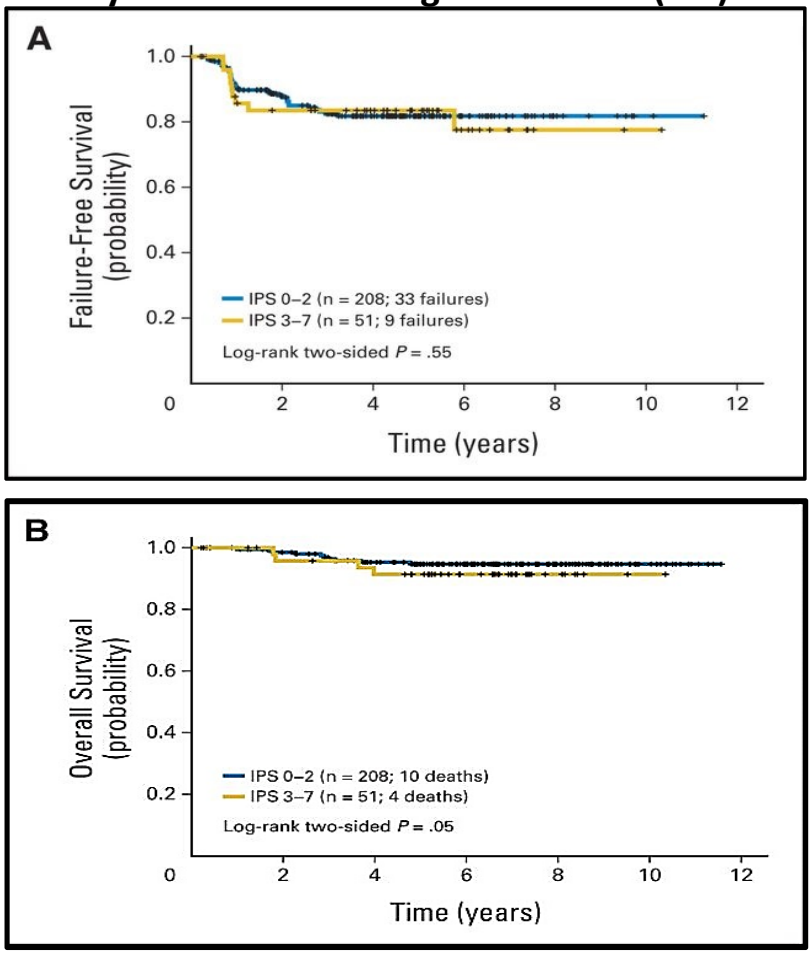
Percival ME, et al. *Oncology.*2014;28(3):253-256, 258-260, C3.

# E2496: Results in Stage I-II Bulky Mediastinal CHL

## By Treatment Arm

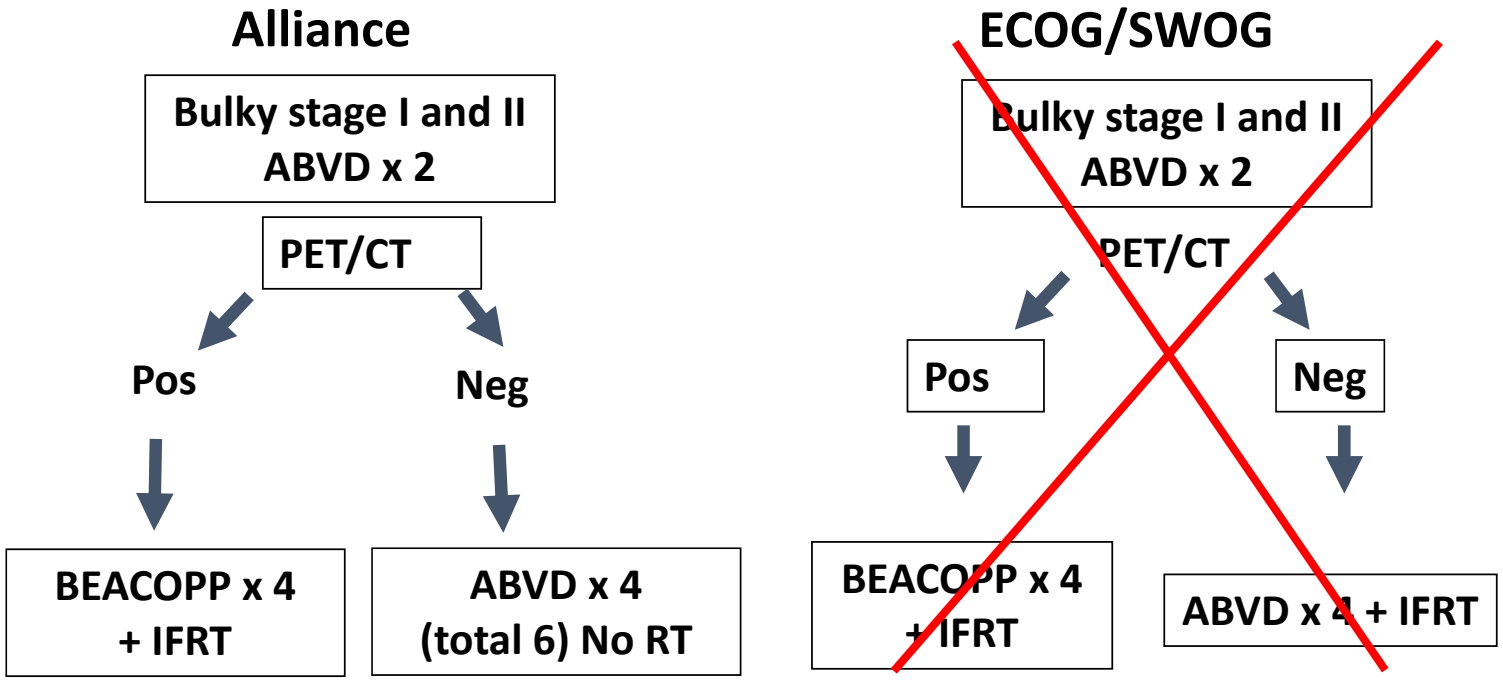


## By International Prognostic Score (IPS)



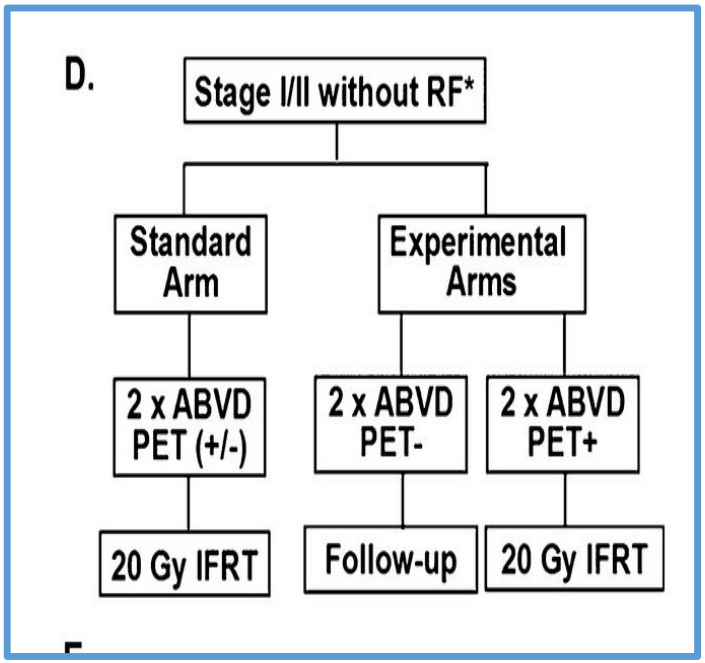
Advani RH, et al. *J Clin Oncol.* 2015;33(17):1936-1942.

# North American Studies in Bulky CHL: Risk- and PET-Adapted

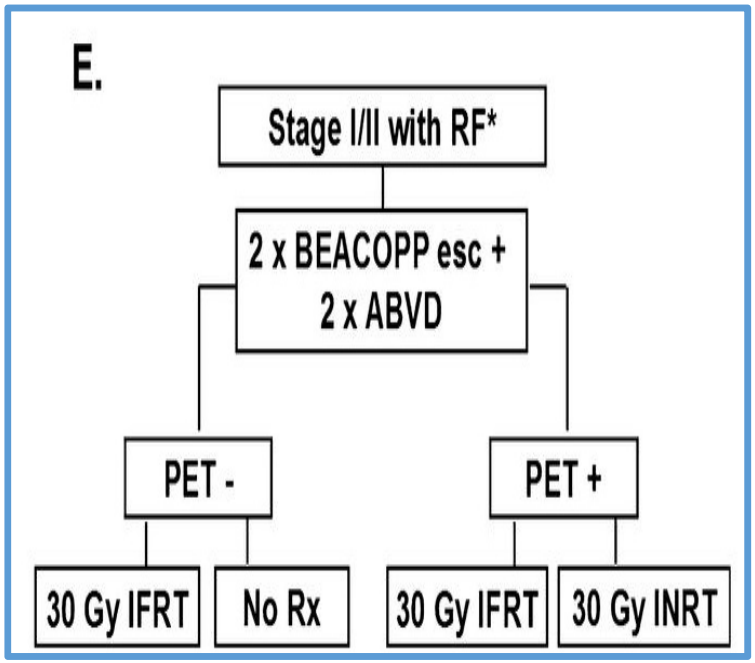


# GHSG: Ongoing Trials in Early Stage CHL

**HD 16**



**HD 17**



Risk Factors: > 2 nodal areas, ESR ≥ 50 (no B sympt)
ESR ≥ 30 (B sympt), MMR > 0.33 (no B sympt/or EN sites)

Evens AM and Kostakoglu L. *Blood*. 2014;124(23):3356-3364.

# Early Stage CHL: Summary of Prospective Trials

- Prognosis of patients with early favorable and unfavorable CHL is excellent
- PET negative patients (Deauville 2) after 2-3 cycles of ABVD
  - Excellent outcome, but experience slightly more treatment failure than those receiving RT
  - INRT/ISRT appears adequate to prevent relapse and may have fewer long-term/late effects than previously seen with IFRT
  - No difference in OS, but follow-up of PET-adapted therapy is very short
- CALGB: Deauville 3
  - Avoids RT in more patients.
  - Esc BEACOPP does not improve outcomes in PET positive patients
  - Need better front line therapy

***CRITICAL TO HAVE PET-CT REPORTS BASED ON DEAUVILLE CRITERIA IF RESPONSE ADAPTED THERAPY IS BASIS FOR TREATMENT DECISIONS***

Meyer RM, et al. *N Engl J Med.* 2012; 366(5):399-408, Raemaekers JM, et al. *J Clin Oncol.* 2014;32(12):1188-1194

## Case 1: Therapy Choices for 36 y female with Stage IIA disease

3 nodal sites (bil neck and upper mediastinum)
GHSG: unfavorable
NCCN and EORTC: favorable

1: ABVD x 2 + 20 Gy ISRT

2: ABVD x 4 + 30 Gy ISRT

3: Stanford V 8 weeks + 30 Gy ISRT

4: ABVD x 2 + Esc BEACOPP x 2 + ISRT

5: ABVD x 3-4 (If interim PET negative)

6: ABVD x 6

# Early-stage CHL:
# Can We Eliminate Radiation Therapy for Most Patients?

## Optimizing Therapy

### Considerations

### Chemotherapy Alone

- Females < age 35 yr
- Axillary and mediastinal involvement

### Considerations

### Combined Modality Therapy

- Patients with favorable disease, especially when it is possible to limit the duration of chemotherapy
- Patients with a positive interim PET scan (~ 25%)
- Patients with bulky mediastinal adenopathy

# Early-stage CHL
# Can We Eliminate Radiation Therapy for Most Patients?

## Balancing Risk With Benefit for the Individual

**Disease Control**

**Optimal Survivorship**

## Stage I-II CHL: Future Considerations

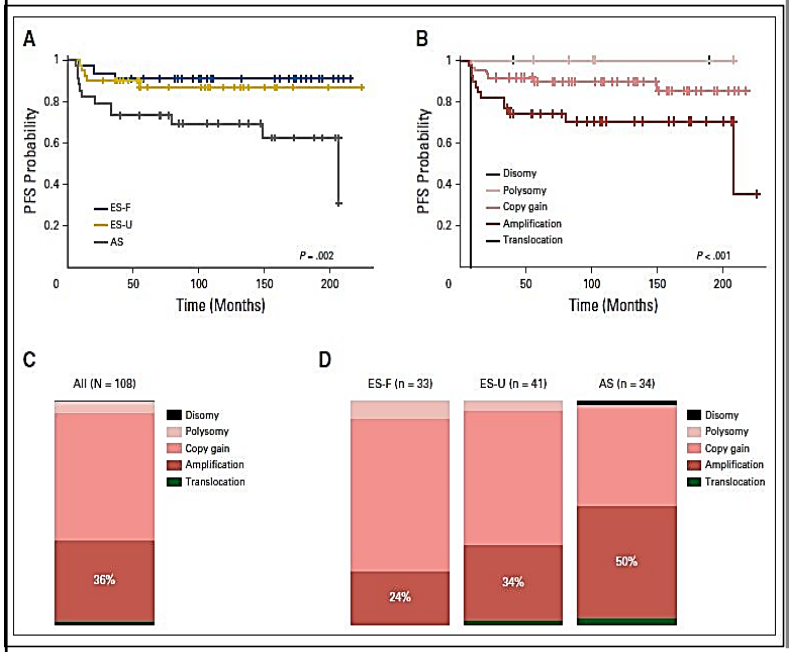
- Incorporation of novel agents
- Identification of biological subsets to guide therapy

## Incorporation of Novel Agents

- Brentuximab Vedotin
- Check Point Inhibitors (Nivolumab, Pembrolizumab)
- Studies combining these agents with AVD (doxorubicin, vinblastine, and dacarbazine) are ongoing in the front line setting

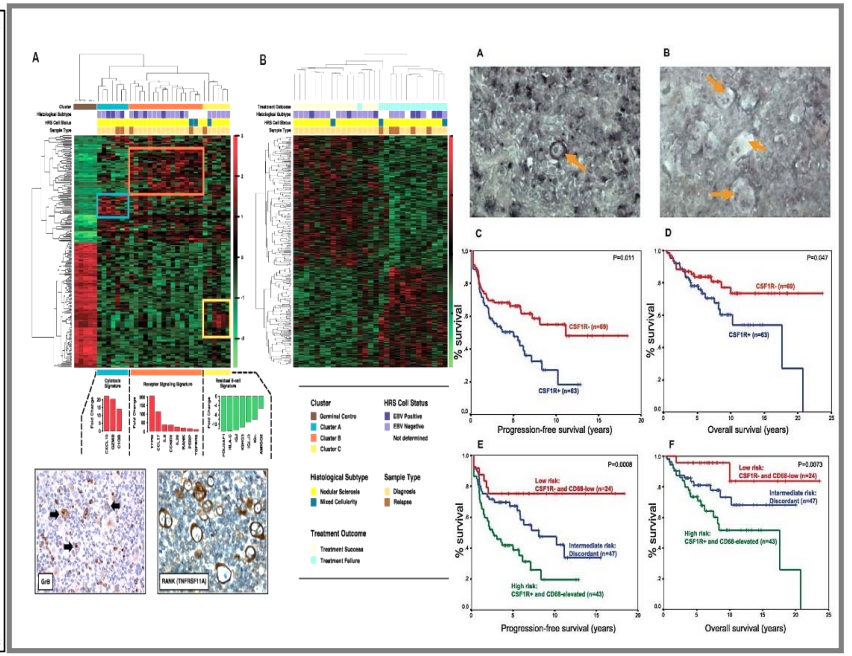
# Identification of biological subsets to guide therapy
# Molecular markers to define risk

## Frequency of 9p24.1 Genetic Alterations and Outcomes



Roemer et al *J Clin Oncol.* 2016;34(23):2690-2697.

## GEP of mico dissected Hodgkin RS cells correlates with treatment outcome in CHL



Steidl et al *Blood.* 2012; 120: 3530-3540.
